

Pre-test Questions

QUESTIONS

Q1. Overfitting Concept

A machine learning model achieves 98% accuracy on training data but only 60% accuracy on test data.

- a) What is the most likely issue?
- b) Explain why this happens.

Q2. Model Evaluation

Explain the difference between:

- Accuracy
- Precision
- Recall

Provide a short example where recall is more important than precision.

Q3. Model Selection

You are given two options to solve a classification problem:

- Decision Tree
- Neural Network

When would you choose a Decision Tree over a Neural Network? Explain your reasoning.

Q4. Feature Importance

What is meant by feature importance in machine learning?

Why is it useful when building models?

Q5. Generalization

What does it mean for a model to generalize well?

Explain one technique used to improve generalization.
